

Jupiter

Big Fun for the Amateur Astronomer!

Jupiter is one of the most popular planets for amateur observers

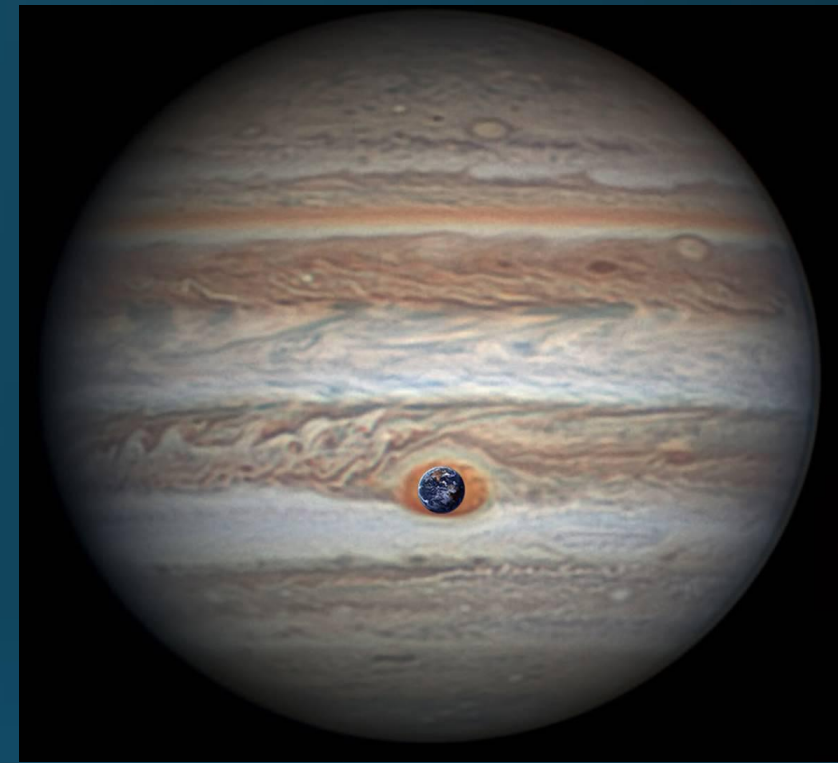

What's the attraction?

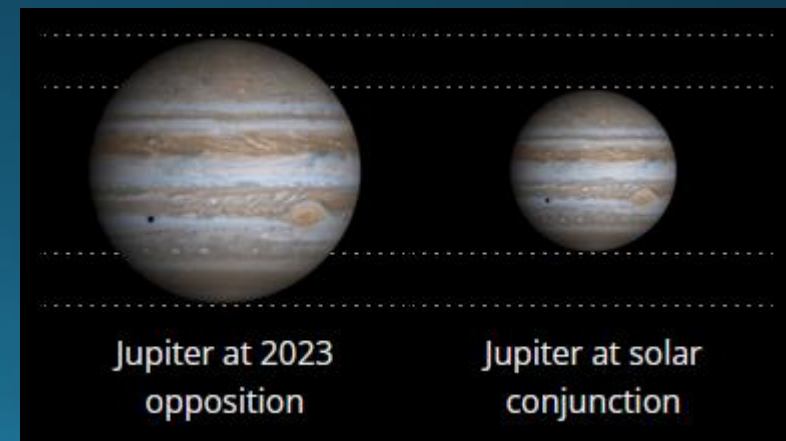

Size!

- Equatorial = 44,425 miles; Polar 41,540 miles
 - Can fit over 1,300 Earths inside Jupiter
 - In fact, even the Great Red Spot (GRS) is larger than our home planet!
- Telescopic size at opposition
 - Orbit Eccentricity 0.049 (Earth 0.017)
 - Aphelic opposition: 43 arc-seconds (507M)
 - Perihelic opposition: 50 arc-seconds (460M)
 - **November 1, 2023 (Aries)**
 - Smallest (Solar conjunction): 30 arc-seconds

Fun Fact!

Credit: NASA

Credit: In-the-Sky.org

Visibility!

- Reliably observable 8 months of a year
- 11.86 years to complete an orbit with synodic period of 399 days (1.09 years)
 - Given 12 signs of zodiac, it advances one sign each year, returning to opposition every 13 months
- No opposition in 2025

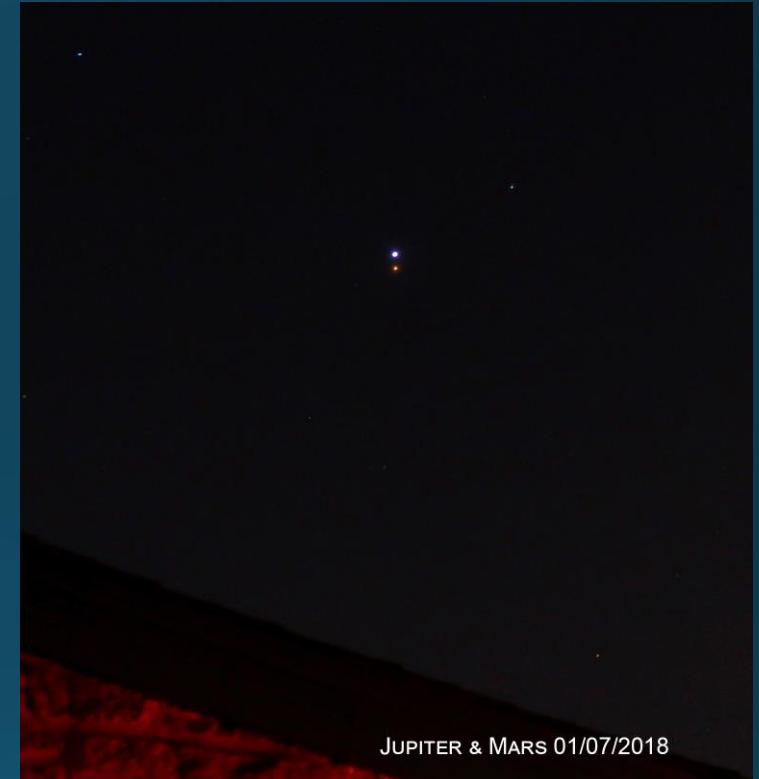

Fun Fact!

August 20, 2021: Aquarius
September 26, 2022: Pisces
November 1, 2023: Aries
December 6, 2024: Taurus
January 9, 2026: Gemini
February 10, 2027: Leo
March 13, 2028: Virgo
April 13, 2029: Virgo
May 14, 2030: Libra
June 16, 2031: Ophiuchus
July 20, 2032: Sagittarius
August 25, 2033: Back in Aquarius

Sky & Telescope 08/20/2021

Bright!

- 4th brightest object (-2.9 at opposition)
- Makes for great conjunctions when pairing with the other bright objects
- Makes imaging easier (higher fps possible with lower gain)
- At the eyepiece when visually observing you want a filter to reduce that brightness

Cool Features!

- Galilean satellites are easily seen and perform transits, eclipses, and occultations with Jupiter
- Cloud bands change appearance from apparition to apparition
- Storms like Great Red Spot (GRS) persist for years and sometimes merge

Planetary Astronomy

Observing, imaging and studying the planets

Edited by **Christophe Pellier**

Frédéric Burgeot, Jean-Jacques Poupeau, Jean-Pierre Prost

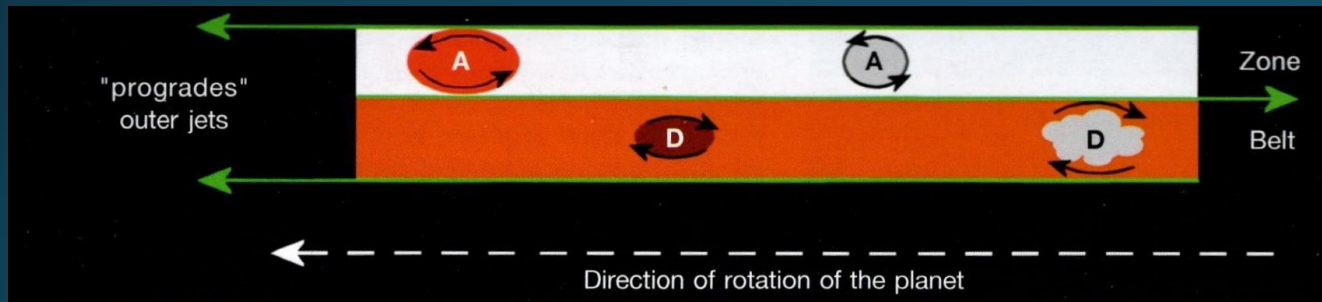

An orientation to Jupiter's features

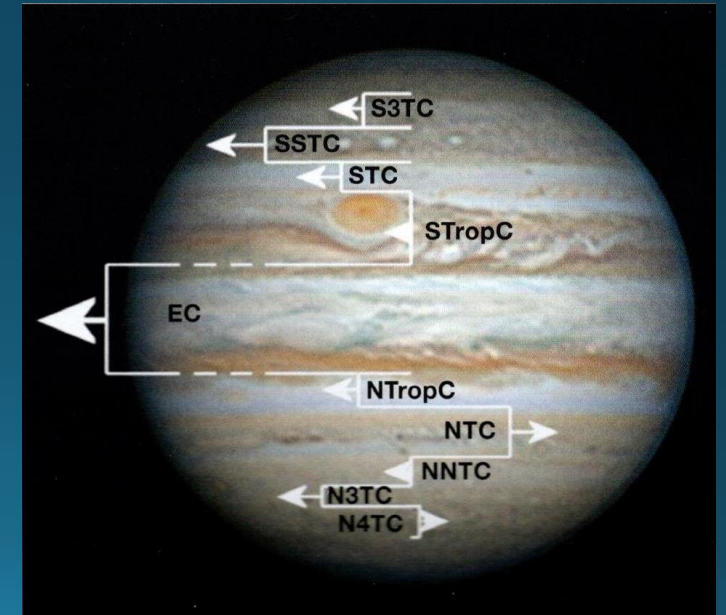

Jovian Nomenclature

Belts & Zones

- Jupiter's fast rotation sets up very strong E-W jet streams in its atmosphere.
 - There are 16 Prograde jets rotate with the planet
 - There are 5 Retrograde jets rotate against the rotation
 - Their combination sets up a slow moving current – the pairing of a belt and zone into a domain that carries along features within it.

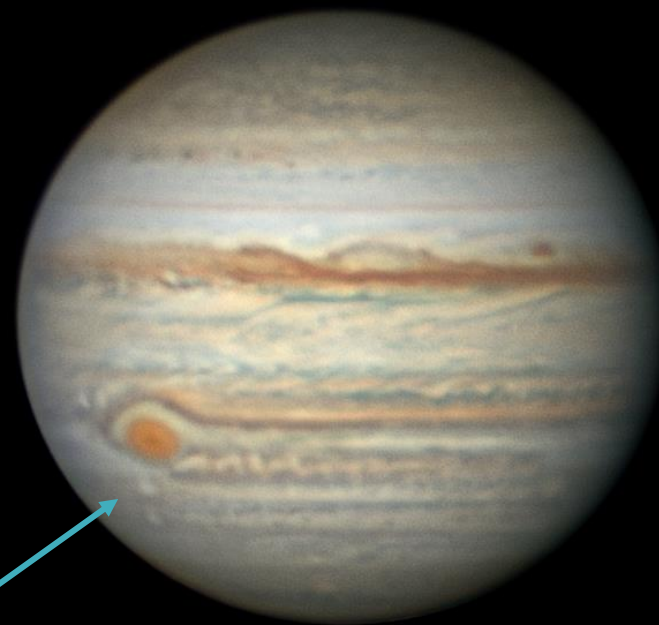

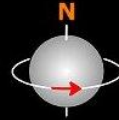

- These currents move at different speeds (faster towards equator) – so you can see features catch up to and move past features in adjacent currents

Below the Great Red Spot the two white oval storms have changed position in four days of rotation. Both images taken with the same equipment.

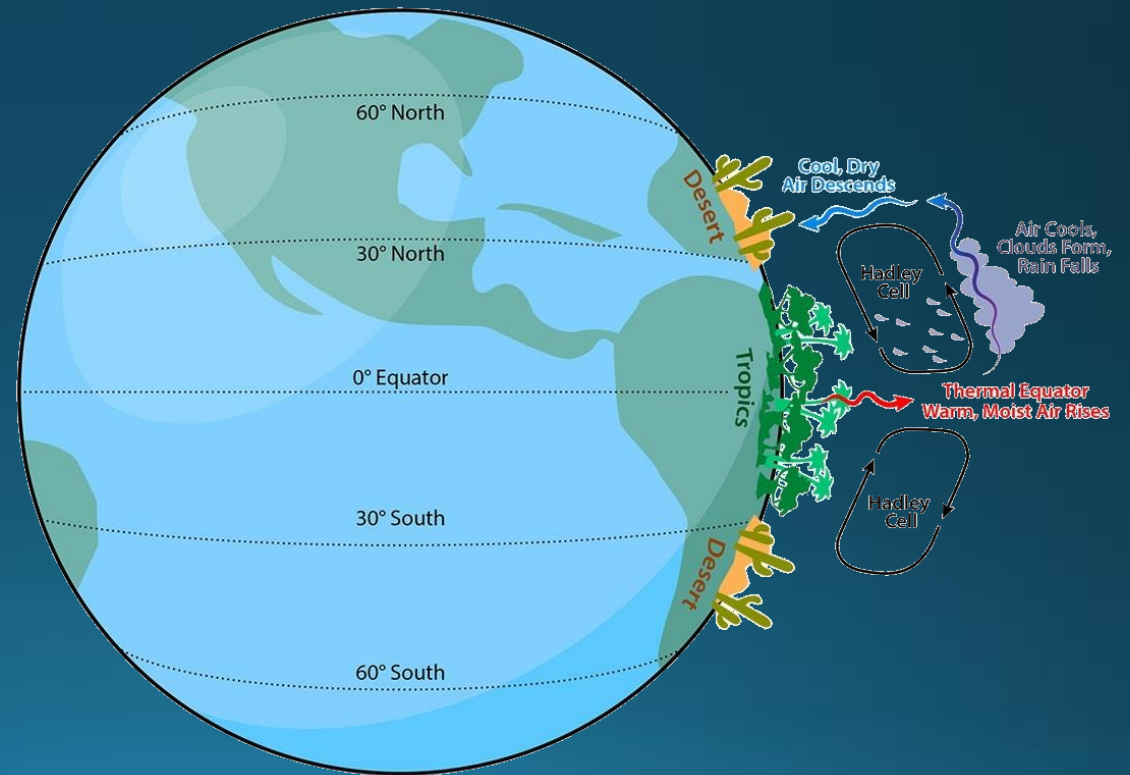

356 mm f/10 SCT + ZWO ASI482MC + ADC + 4x PowerMate

Peter Tickner

Berkshire

Belts & Zones

- A pairing of belt & zone forms a large unit of atmospheric convection, a “Hadley Cell”
 - Vertical circulation of the air due to temperature differences. Warm air rises, cools, and then sinks.
 - The white zone represents ascending air that forms ammonia ice clouds, while the belt is dryer, descending air where the white ammonia ice has dissipated to reveal a deeper layer of the atmosphere

Jupiter at the eyepiece

Visual Observing

What's Needed?

- Telescope
 - While some factors such as central obstruction can make one telescope type superior to another at equivalent aperture, size is still the primary factor in what you can see
 - Collimation is important
- Quality Eyepiece (10-5mm)
- Stable mount
- Optional (but recommended)
 - Tracking so that you can observe the planet for a long period of time
 - Filters (Yellow helps overall; blue can help with GRS)
- Steady seeing!!
- Patience

The Easy Stuff

	Small 80-120	Medium 125-200	Large 225-275	X-Large 300 & above
Oval Appearance	✓	✓	✓	✓
Equatorial Belts				
Shadow Transit				
Eclipse				
Great Red Spot				

- Jupiter has the fastest rotation rate of any planet – just under 10 hours
 - Equatorial region (System I) 9h 50m
 - Elsewhere (System II) 9h 55m
- This centrifugal force causes a bulging at the equator

The Easy Stuff

	Small 80-120	Medium 125-200	Large 225-275	X-Large 300 & above
Oval Appearance	✓	✓	✓	✓
Equatorial Belts	✓	✓	✓	✓
Shadow Transit				
Eclipse				
Great Red Spot				

- The North Equatorial Belt (NEB) is usually the thinner of the two, but more intense in its color
 - It is currently very thin – we are monitoring for a “revival that may come this year or next
- The South Equatorial Belt is usually wider and not as prominent.... **but not always!**

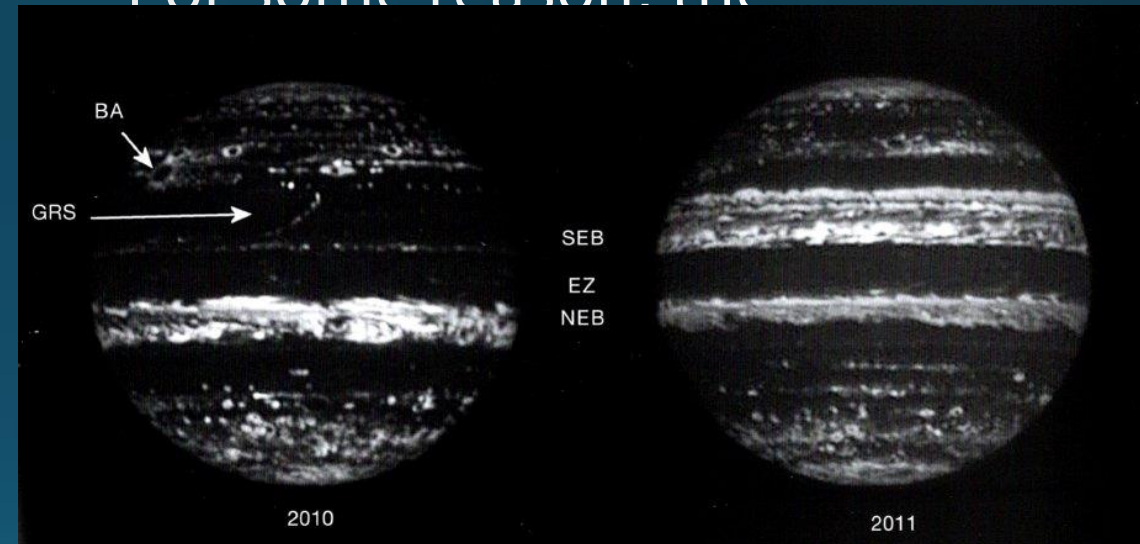

The Great SEB Disappearing Act

- Every ~15 years the SEB undergoes a set of two fadings over ~4 years

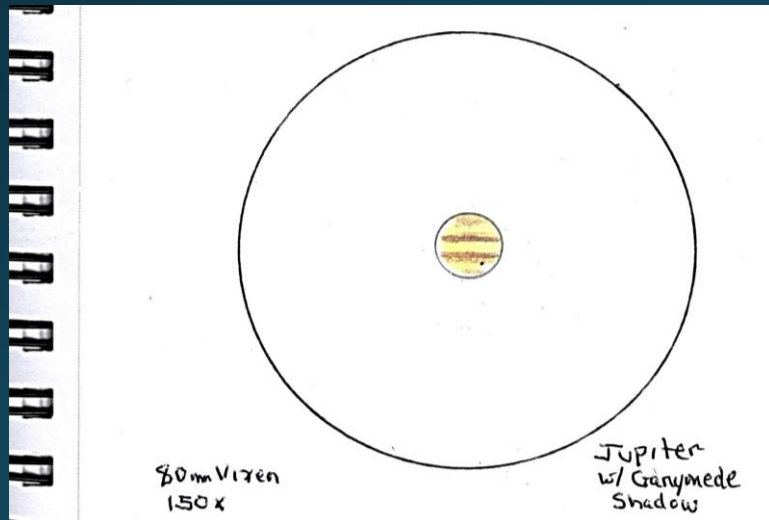

Credit: Anthony Wesley

- For some reason, the

The History of BA

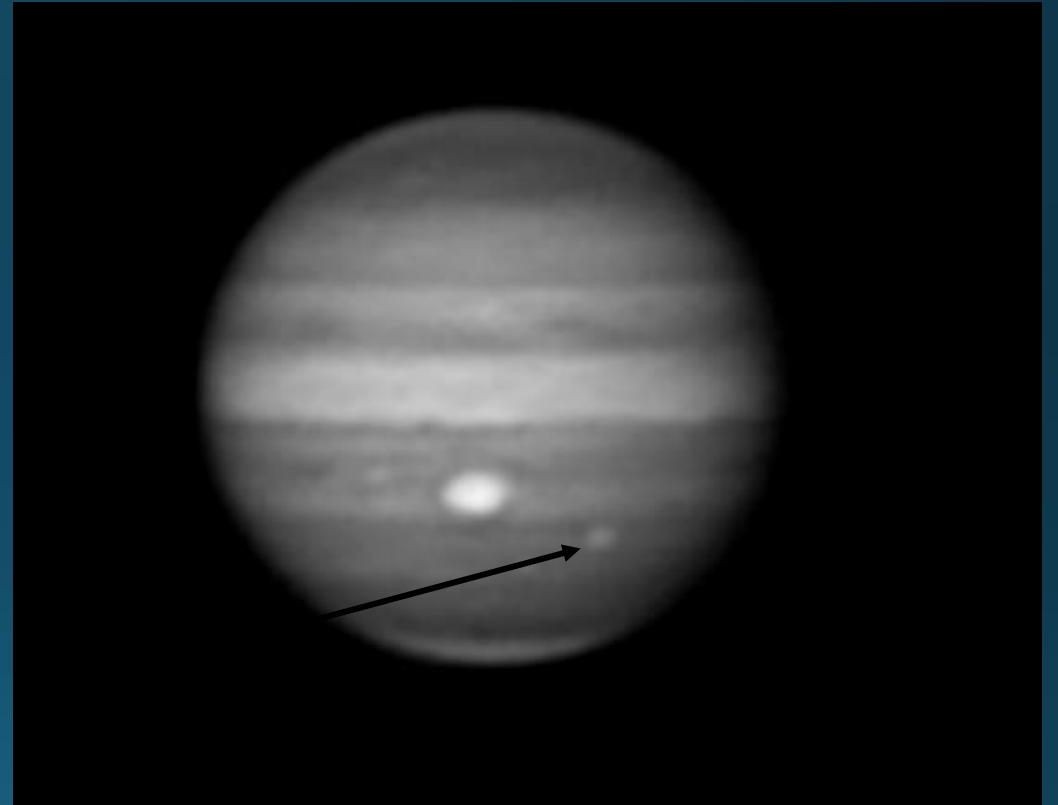

- Oval BA is actually the product of 3 large ovals in the STB that emerged in the late 1930s.
 - For 60 years they drifted about the belt. When approaching one another they would somehow slow down or even reverse course.
- Late 1997/early 1998 while near Solar conjunction, DE and BC did collide and merge (2nd panel)
- Finally FA also approached BE and became what we now know as Oval BA

Oval BA – a.k.a. Red Spot Jr.

“Observing and imaging the Galilean moons, as they transit the planet's disc, can be a challenging feat. Apart from when a Moon is passing over the darker limb regions, most of them will have a similar albedo to Jupiter's bright zones and, unless seeing is perfect, the Moon will become lost in the Jovian background. The one exception to this is **Calisto**, which is by far the darkest Moon with an albedo of 20%. (Io, Europa and Ganymede have albedos of 61, 64, and 42% compared to Jupiter's average albedo of 43%.)”

Getting Started with Computer Assisted Planetary Imaging

Imaging Primer

What's Needed to Start?

- Telescope
 - 100 mm or greater in aperture
 - f/ratio > 6
- Tracking
- Color video camera
- Laptop for capture & processing
- Software (open source)
- Optional (but recommended)
 - UV/IR cut filter
 - Barlow
- Steady seeing!!

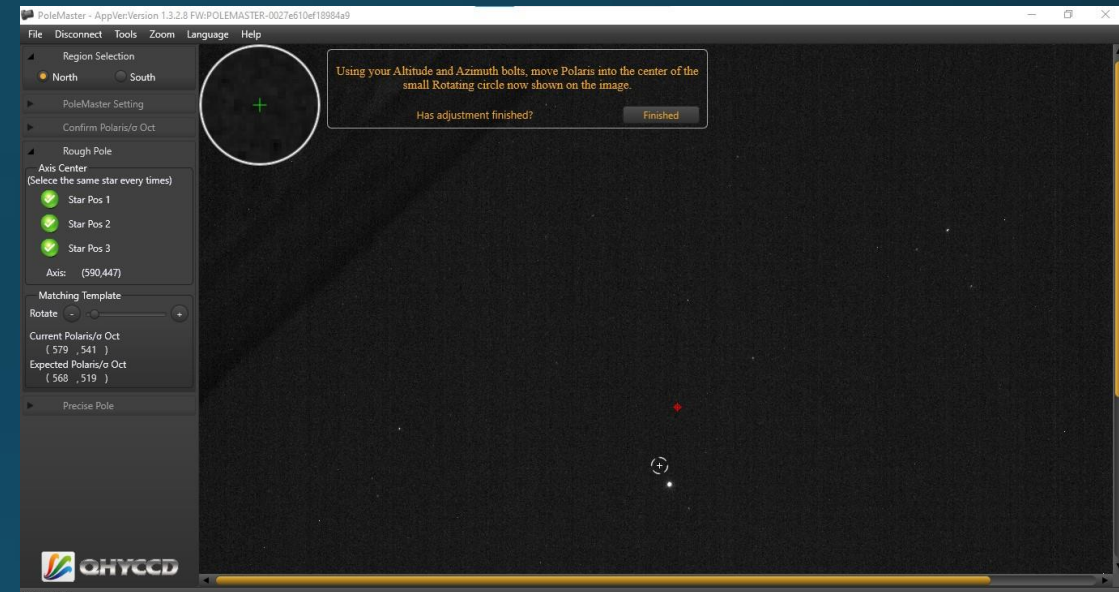

Video Camera

- Wide range of providers
 - ZWO
 - Celestron
 - Imaging Source
 - QHY
 - Orion
- Using your DSLR
 - Heavy and requires T-Ring adapter
 - Only in debayer mode

Sample Video Capture Process

- Polar align telescope

Sample Video Capture Process

- Polar align telescope
- Check collimation

Sample Video Capture Process

- Polar align telescope
- Check collimation
- Align finder scope

Sample Video Capture Process

- Polar align telescope
- Check collimation
- Align finder scope
- Insert Barlow and camera, check balance

Sample Video Capture Process

- Polar align telescope
- Check collimation
- Align finder scope
- Insert Barlow and camera, check balance
- Connect to laptop & launch capture program

Sample Video Capture Process

- Polar align telescope
- Check collimation
- Align finder scope
- Insert Barlow and camera, check balance
- Connect to laptop & launch capture program
- Center planet, focus

<https://www.youtube.com/watch?v=RDuDjlvXWI>

Sample Video Capture Process

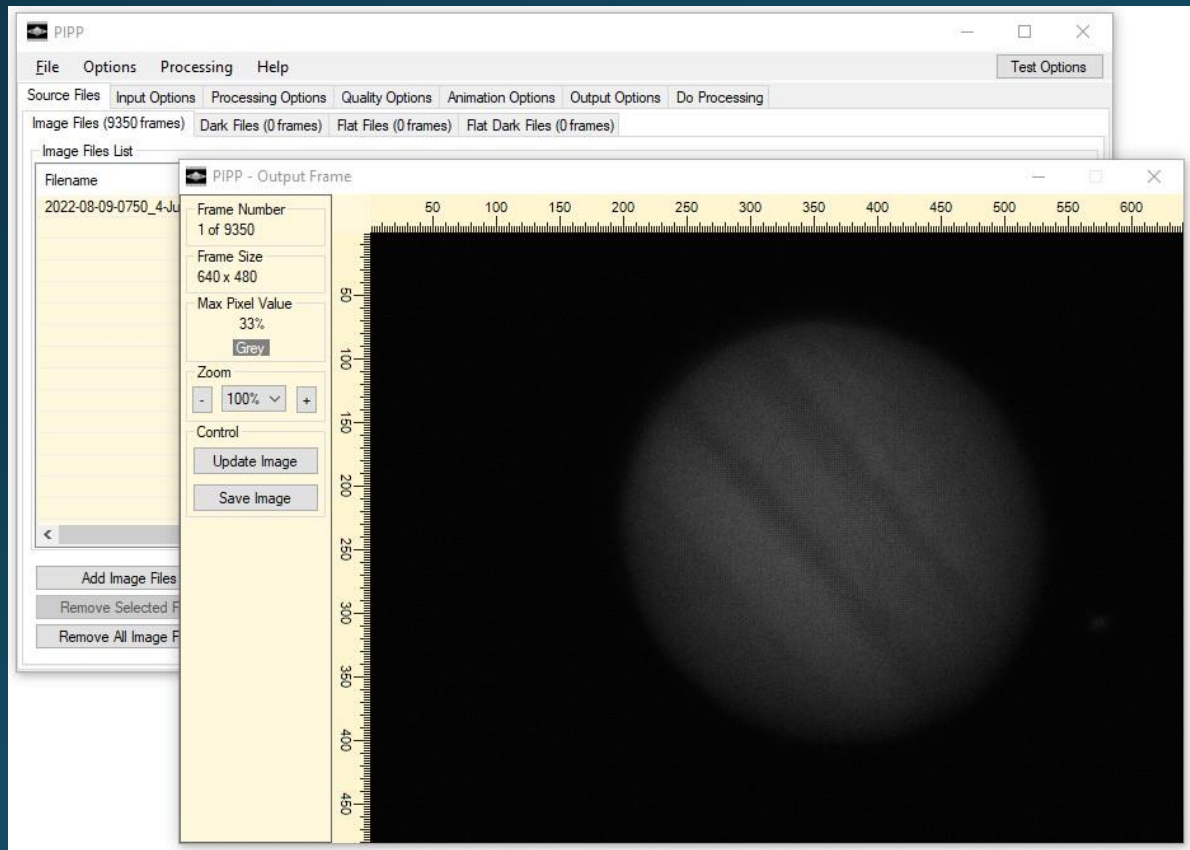

- Polar align telescope
- Check collimation
- Align finder scope
- Insert Barlow and camera, check balance
- Connect to laptop & launch capture program
- Center planet, focus
- Set ROI as small as possible
- Adjust shutter and gain to get best possible fps rate without grainy frames
- Take series of 1-2 minute videos with debayer turned off

<https://www.youtube.com/watch?v=XfRybLlt3v4>

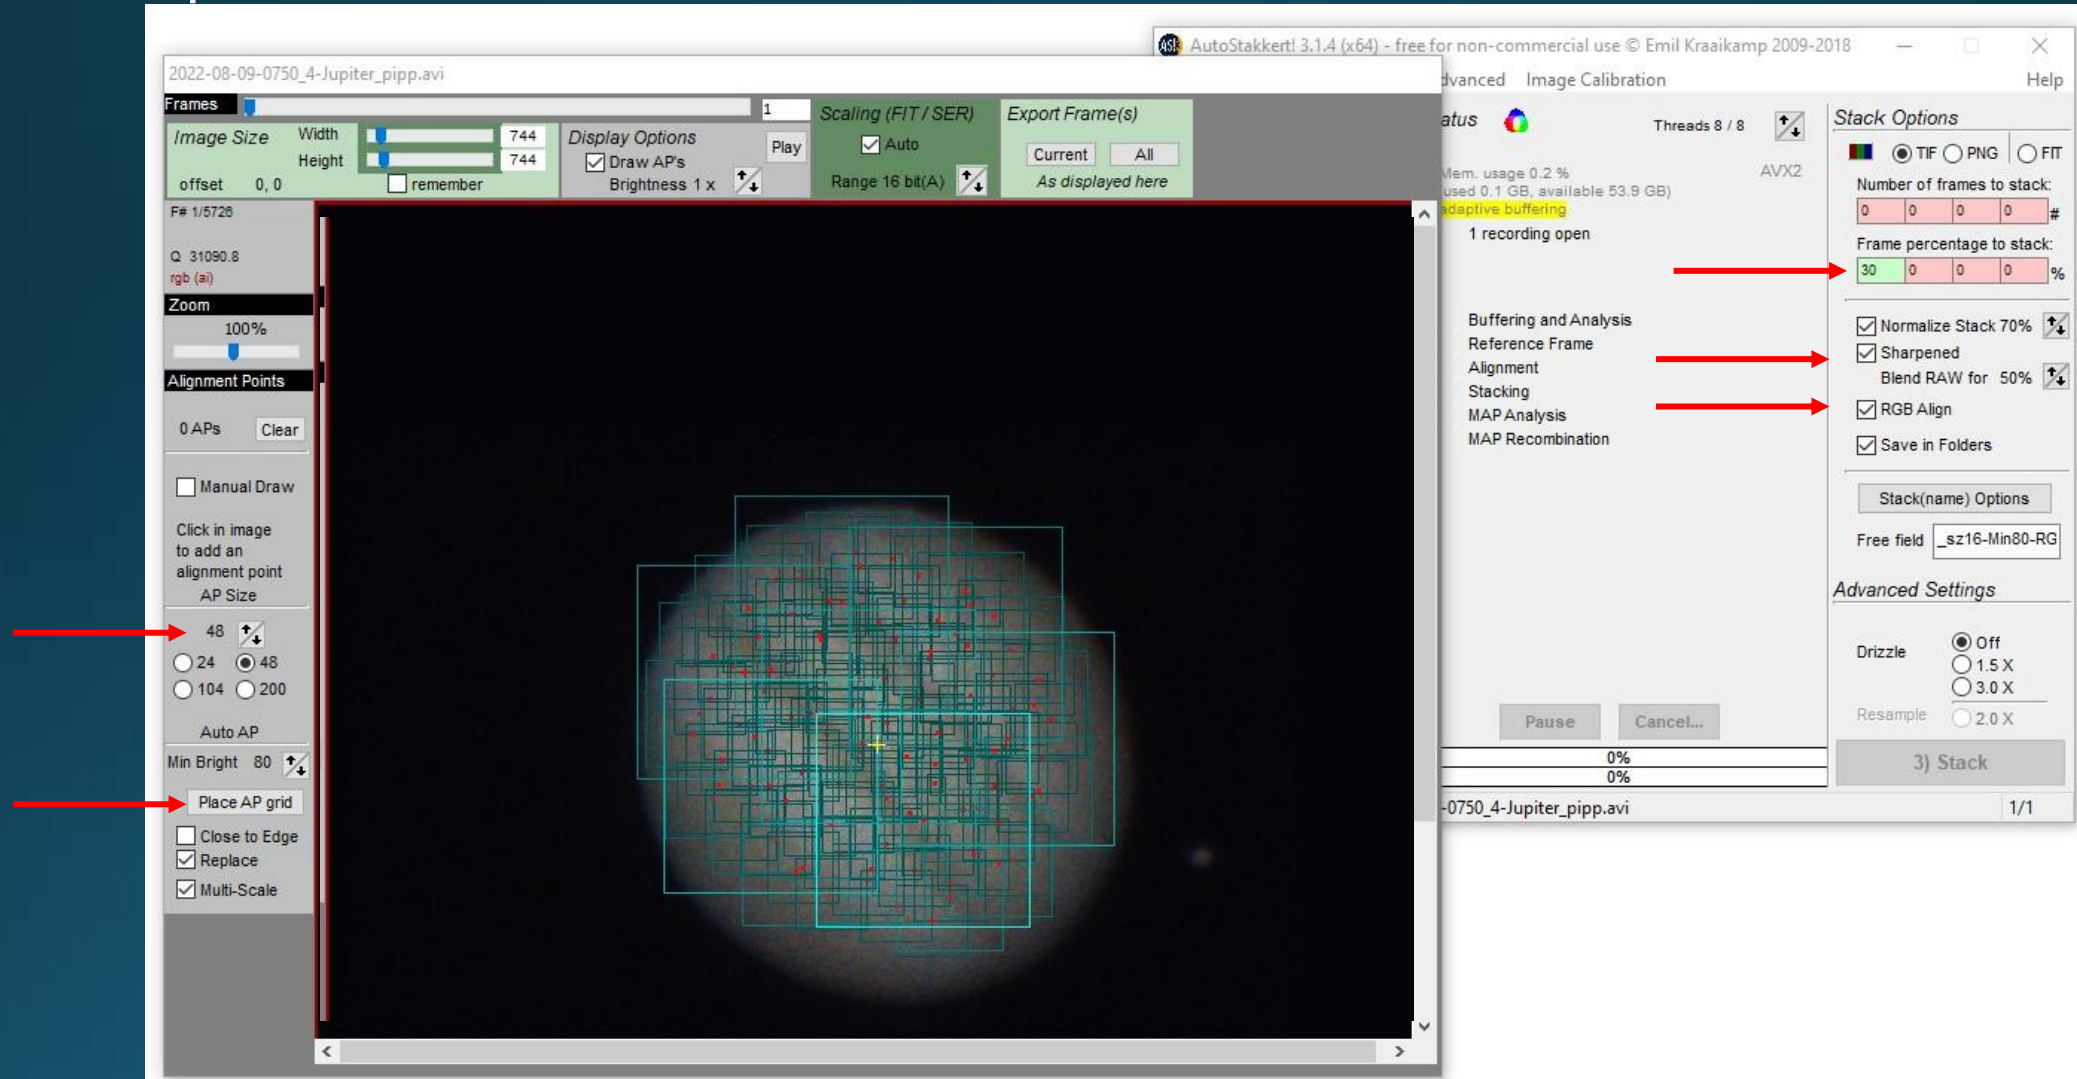

Sample Video Processing Flow

- Planetary Imaging PreProcessor (**PIPP**) to debayer, center, crop, and extract best frames into a video

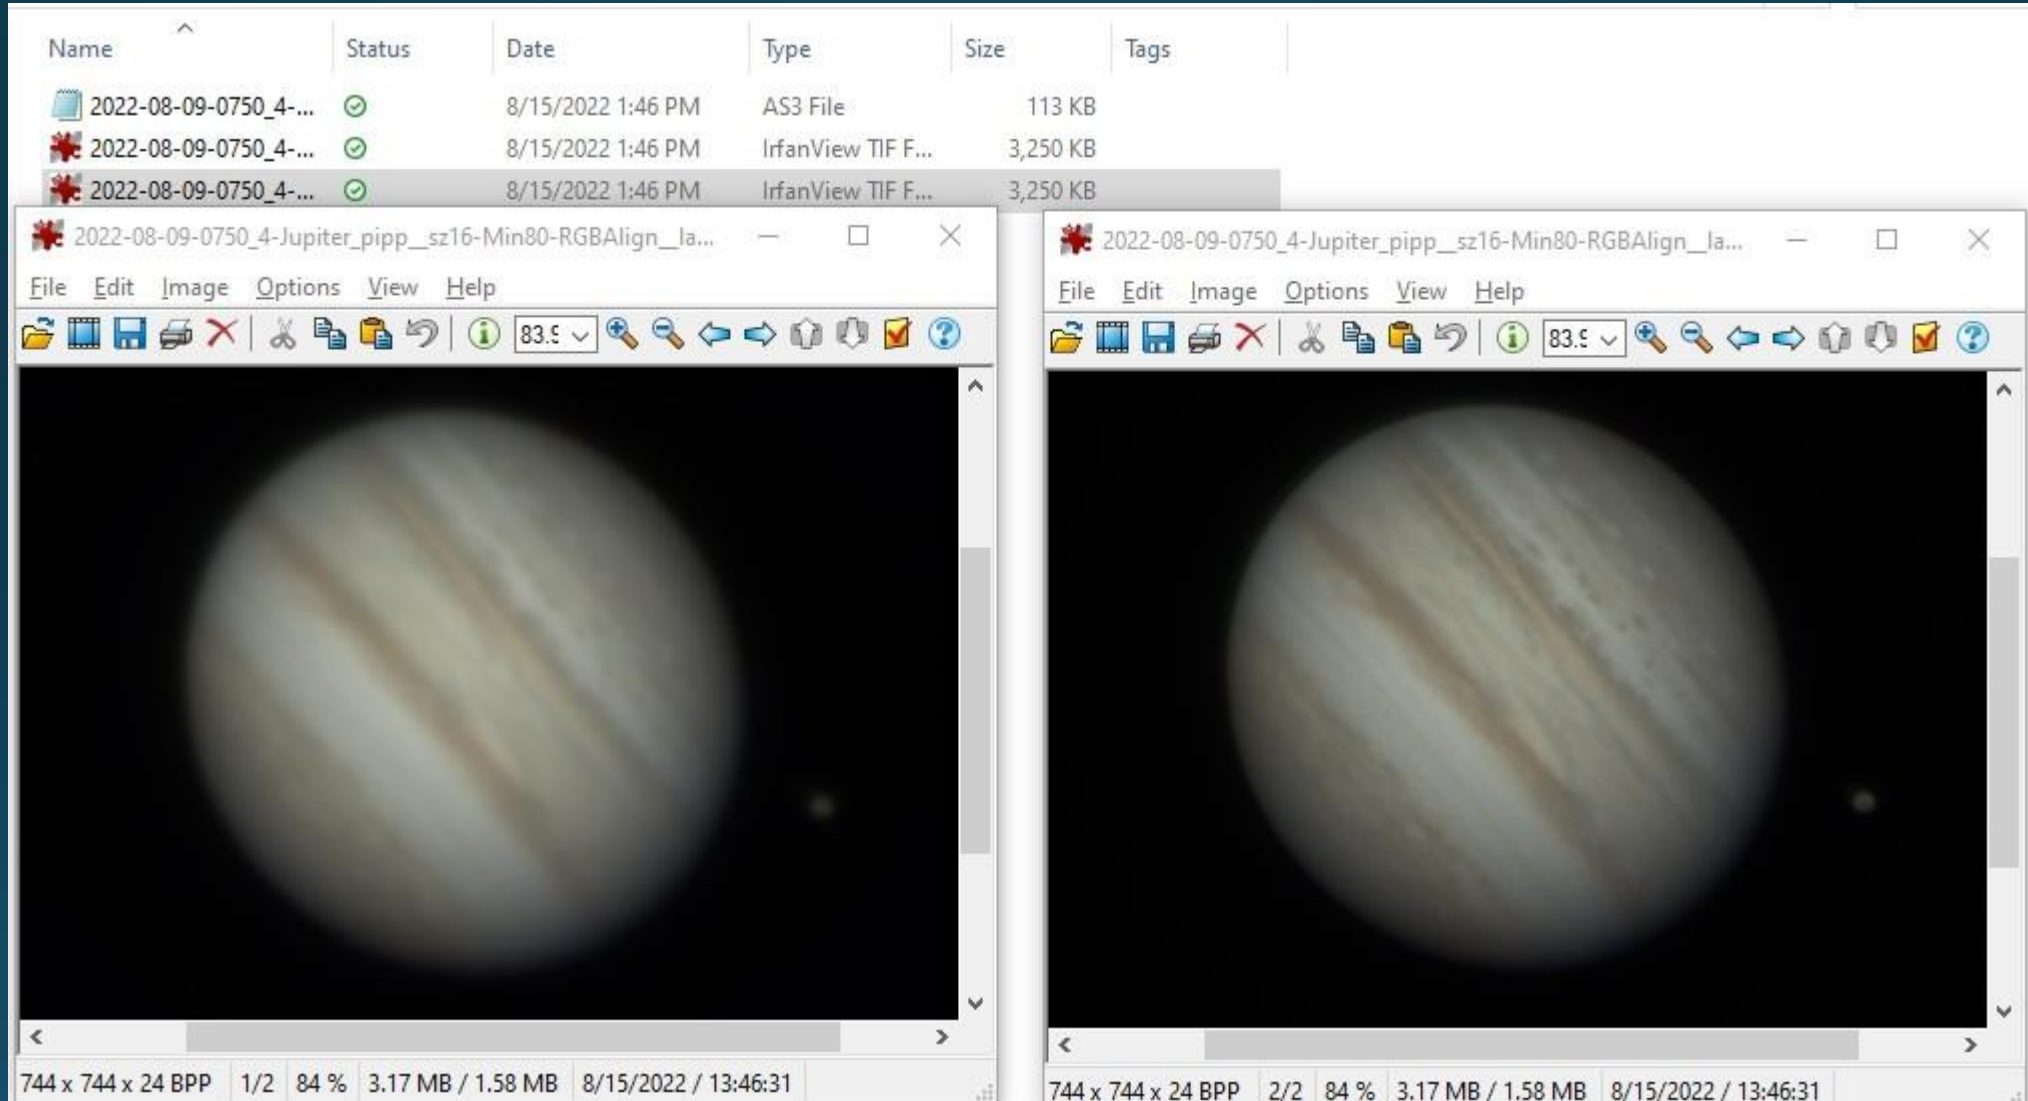

Sample Video Processing Flow

- **Autostakkert3!** to align and stack the best frames from your PIPP output into a TIFF

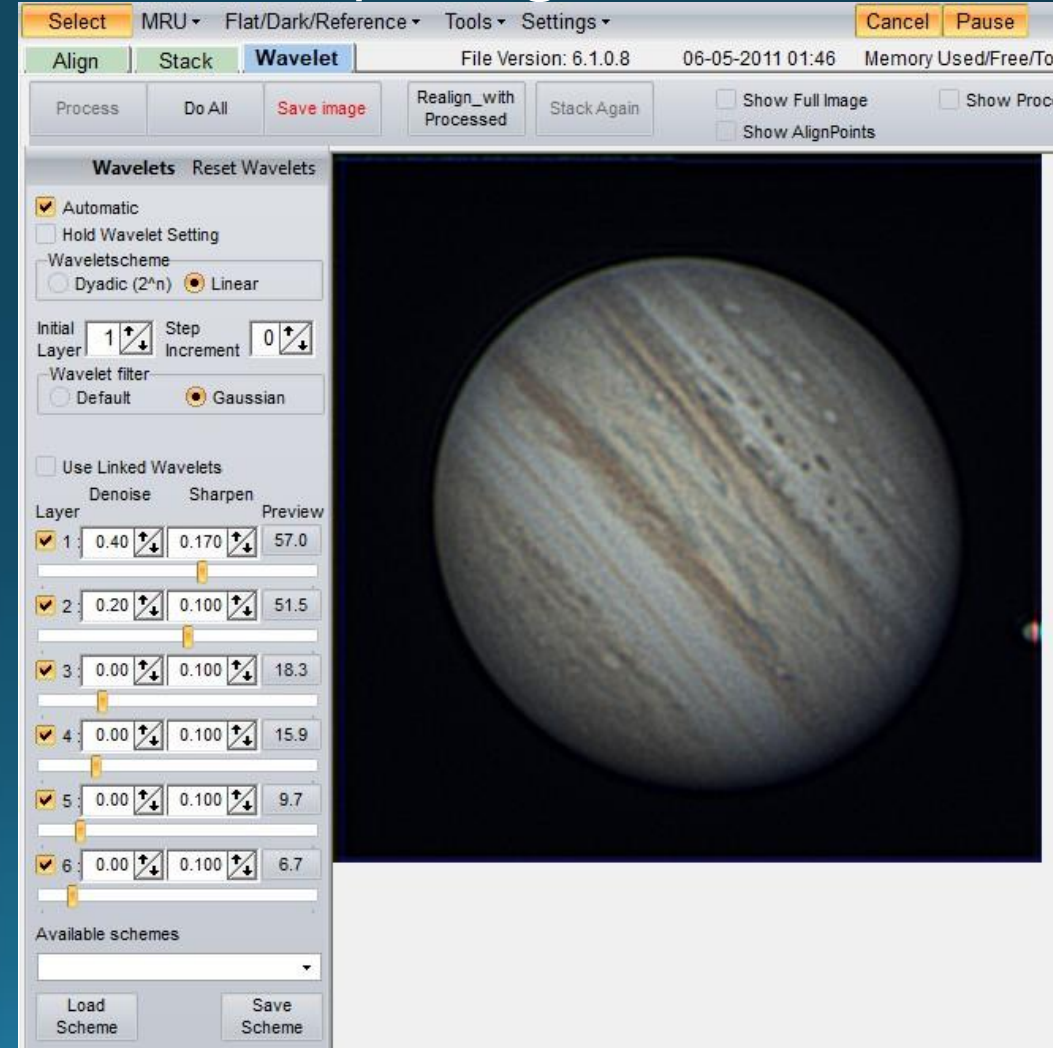

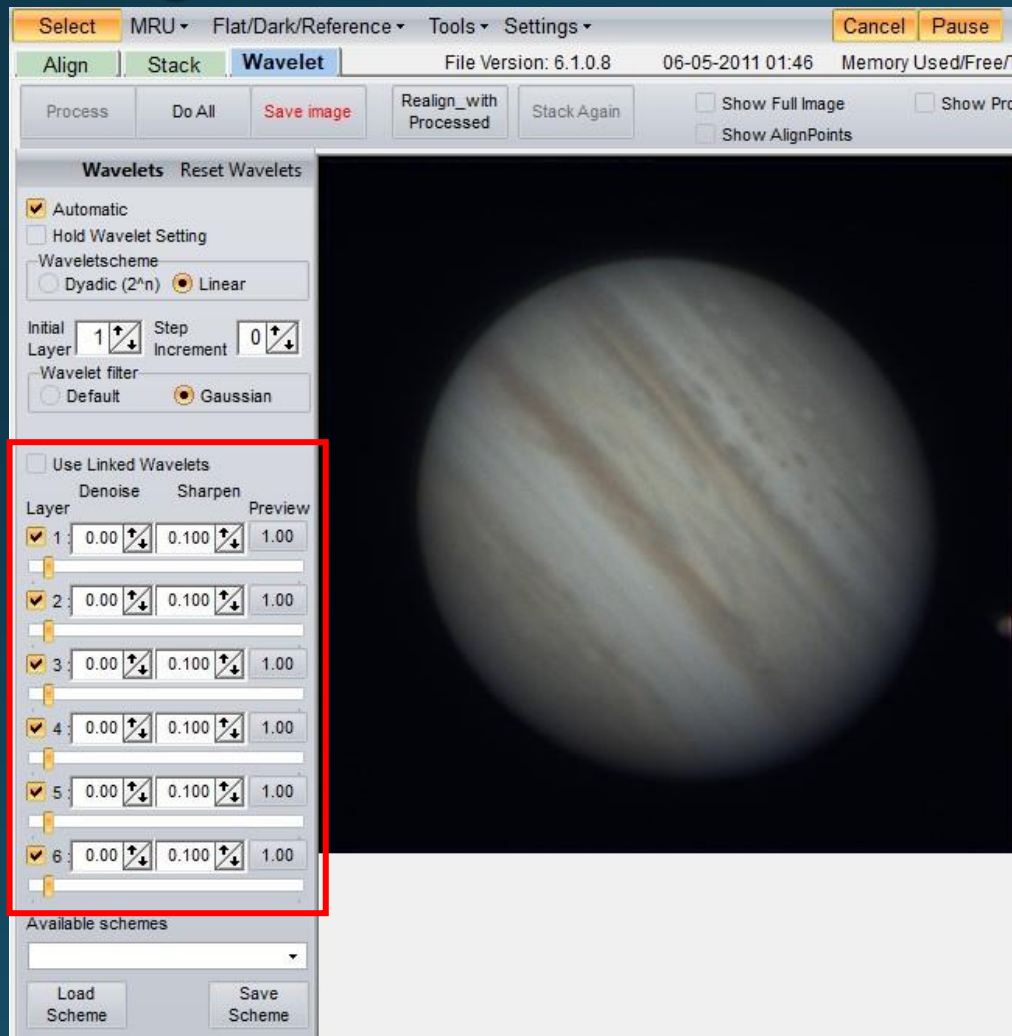

Sample Video Processing Flow

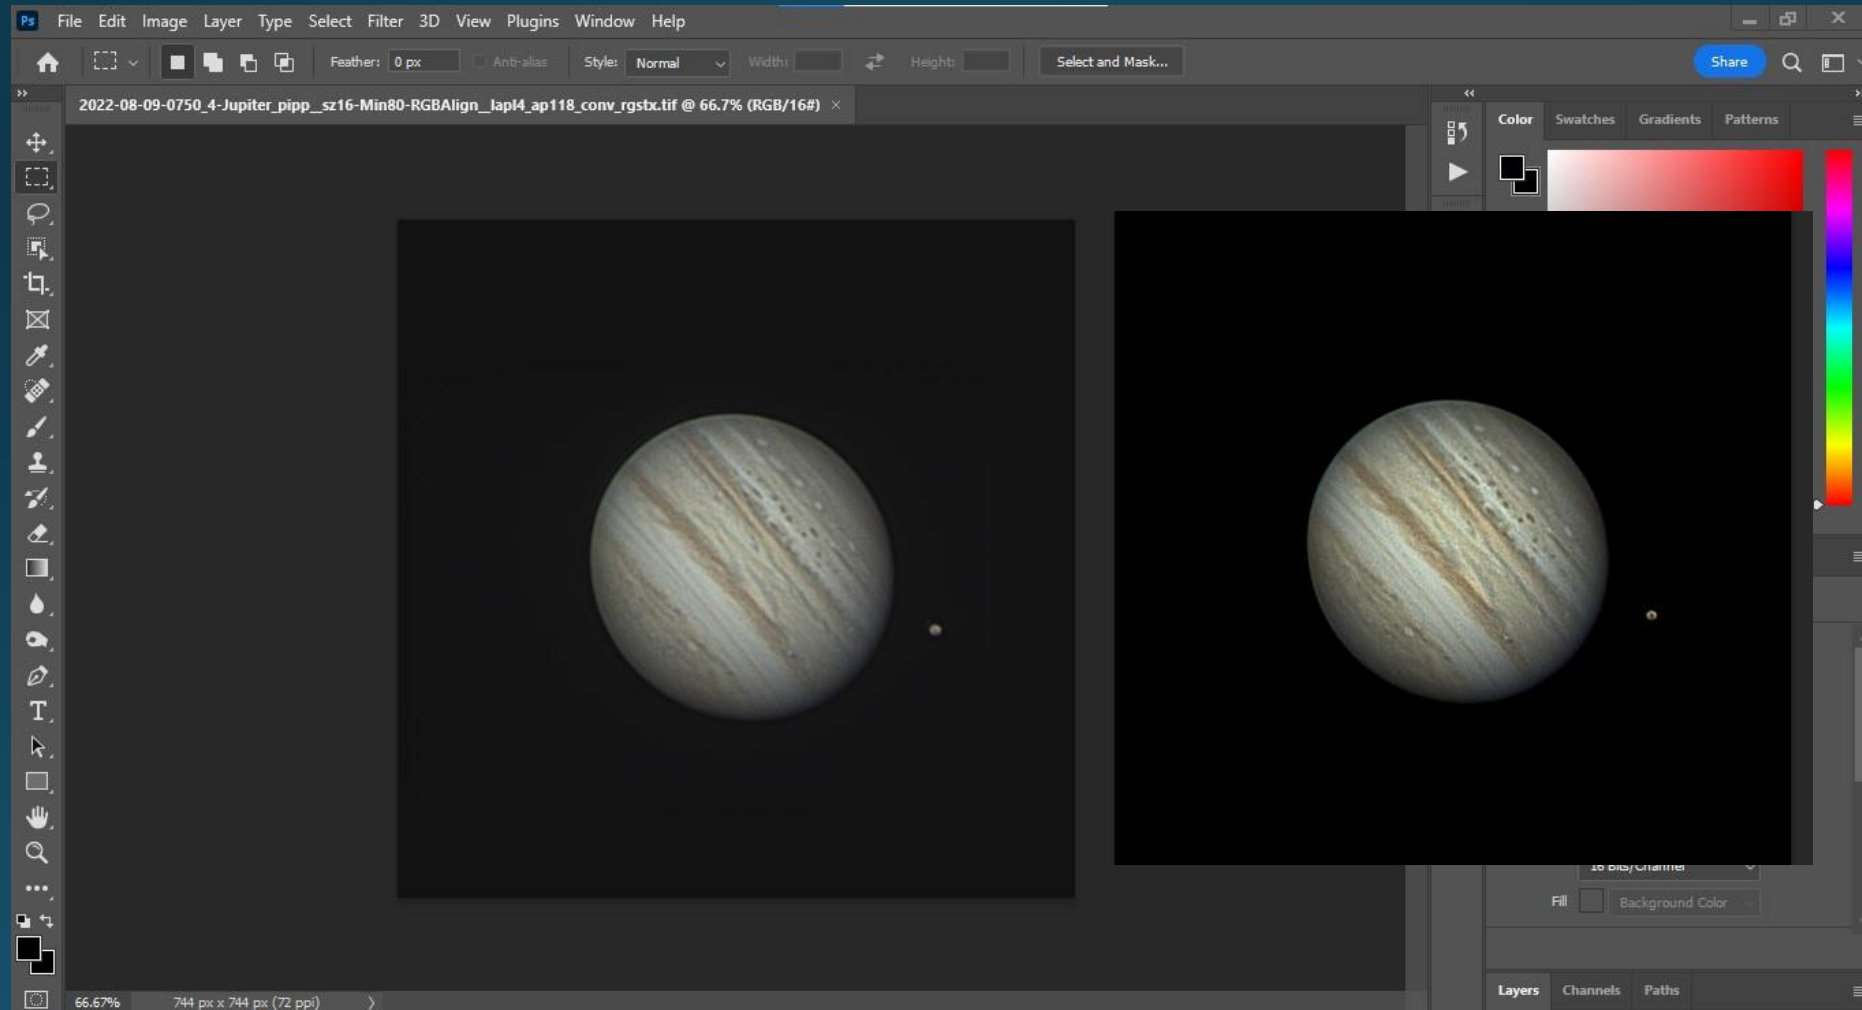

Sample Video Processing Flow

- **Registax6** for wavelet transformation (sharpening)

Sample Video Processing Flow

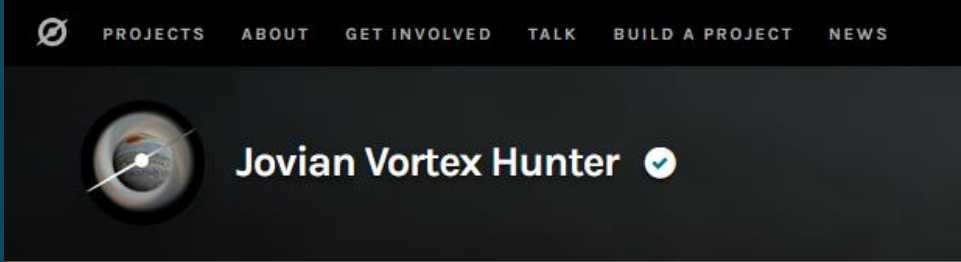

- Finally, a photo editing application of your choice to enhance the Registax sharpened image

Enjoying Jupiter without a telescope

Armchair Activities

Participate in Jovian Vortex Hunter

- This online site seeks input from citizen scientists to identify and catalog vortices seen in Juno images in an effort to better understand Jupiter's atmosphere.

A screenshot of the Jovian Vortex Hunter task interface. On the left, there is a square image of Jupiter's atmosphere showing swirling cloud patterns. Below the image are small icons for help, a heart, and a list. On the right, there is a form with two tabs: "TASK" (selected) and "TUTORIAL". The "TASK" tab contains the instruction: "Identify the features that are present in this image. Note: You can select multiple answers!". Below this are five buttons: "Vortices: one/more" (teal), "Turbulent region" (teal), "Cloud bands" (light gray), "Image is featureless" (light gray), and "Image is too pixelated or distorted." (light gray). At the bottom of the form, there is a link "NEED SOME HELP WITH THIS TASK?" and two buttons: "Done & Talk" (blue) and "Done" (green).

<https://www.zooniverse.org/projects/ramanakumars/jovian-vortex-hunter>

Drift Analysis with WinJUPOS

- WinJUPOS is a free software app that seeks “to collect precise positions of Jovian cloud features, to analyze them in drift charts, and to examine if and how their movements change in time”
- Using online images you can identify the Jovian longitude and latitude of a feature and then track its drift. You can also post them online (or sign up to be a measurer and submit data to WinJUPOS)
- WinJUPOS is an amazing program with lots of functionality, would merit its own talk 😊

WinJUPOS 12.1.2 - Database for Object Positions on Jupiter - [Measurements of Jupiter images 2022-08-09-0753.5-JmTmn-Min80-RGBAlign_lapl2_ap208_conv_rgstx_ps]

The screenshot displays the WinJUPOS software interface. At the top, the title bar reads "WinJUPOS 12.1.2 - Database for Object Positions on Jupiter - [Measurements of Jupiter images 2022-08-09-0753.5-JmTmn-Min80-RGBAlign_lapl2_ap208_conv_rgstx_ps]". Below the title bar is a menu bar with "Program", "Recording", "Analysis", "Lists", "Administration", "Tools", "Window", and "Help". A toolbar contains buttons for "Imag.", "Adj.", "Pos.", "Misc.", and "Opt.", followed by a series of coordinate and position fields: "CM1 128.8°", "CM2 113.2°", "CM3 30.9°", "CLat +3.0°", "X -1.921", "NR", "Close", "Y -0.684", "-->", and "Help". The main window is divided into two panes. The left pane, titled "Image", contains various adjustment controls: "Channel (F9) Colour", "Zoom (+/-) 1.54", "Rotation (L/R) 0", "Gamma (G) 1.00", "Contrast (C) 1.00", "Brightness (B) 0", an unchecked "LD compensation" checkbox, "LD value 1.00", "LD angle 65", and buttons for "Image" and "Outline frame". The right pane, titled "Outline frame", contains a checked "Draw outline frame" checkbox, a "Without additional graphic" dropdown, and buttons for "Outline frame" and "Image & outline frame". The central area shows a large, circular image of Jupiter with its characteristic bands. A red arrow points to a small, bright object in the upper right quadrant of the Jupiter image. Another red arrow points to a small, bright object in the upper left quadrant of the Jupiter image. A third red arrow points to a small, bright object in the lower right quadrant of the Jupiter image. The status bar at the bottom displays the date and time "2022/08/09 07:53.5", the file path "C:\Jm\PlanetaryVideo\Jupiter\2022-08-09Z\AS30-Output\edited\2022-08-09-0753_5-JmTmn-Min80-RGBAlign_lapl2_ap208_conv_rgstx_ps_mv_psp.tif", the image dimensions "Ø 346.5 pixels", the scale "0.1333" / pixel", the rotation "RotA 359.91°", and the frame rate "FR 1:6".

ALPO Imaging Training Program – Beta Testing

- For years ALPO has provided training for members to sharpen their observing skills. We want to explore starting an imaging training program for our members
- We need to evaluate what resources are helpful to new imagers as well as gauge how much time & effort the mentor should anticipate providing
- I do have an old camera that you can borrow for this initiative
- If you are a member of HAL and want to explore starting to image Jupiter, please head over to this online form and let me know of your interest.
